### **Abstract of EP0422258**

The proportion of organic material in an organo-mineral fertiliser is to be increased. To this end there is proposed a preparation method in which a mixture consisting of a stabilised compost in which the more readily biodegradable components are decomposed aerobically, mineral additives and organic crosslinkers which are biodegradable or chemically degradable, is compressed or shaped by other means, is heated and cooled. The organic crosslinker proposed is a polymer based on polybutadiene. The mixture is shaped to give pellets of 2 to 5 mm in size. The pellets are subsequently sprayed with the crosslinking agent so that a crosslinked layer is formed, and heated at 70 DEG C for 15 - 30 minutes.
